Exercise 7: Encapsulation

This task is about modelling traffic lights. Good luck!

If you have any questions or problems, please write to us in Moodle!

Aufgabe 1 — Primzahlen

a) *Open https://git.uni-due.de/vs.ude/objektorientierte-programmierung-cpp. Use git to* clone *the repository and import the project into 07_Encapsulation.*

b) *Use the principles of encapsulation and abstraction learnt in the lecture to prevent access to the internal red/green/yellow_on variables. On the other hand, write methods that enable transitions from one state to another (e.g.* `void green_to_yellow()` *) so that there is a meaningful interface that can be used to call the correct transitions from outside.*

c) *Hmm, but now it's silly that the developer himself has to know which state should come after the other. Can you make sure that your* `TrafficLight` *only has two public methods* `print_traffic_light()` *and* `next()` *and that it is internally recorded which state is current and which method should be called next?*
